

**SAVING
LIVES
FASTER**

PROJECT

LIFEGUARD

When seconds count, the AED needs to actually be there.

THE PROBLEM

10% of cardiac arrests happen near a listed AED.

But 'listed' doesn't mean present. Or accessible. Or charged.

< 90s

Window to survive without permanent brain damage

~40%

AEDs in public databases that are unverified or outdated

10%

Survival rate without an AED on scene

ROOT CAUSE

The database says it's there. The database is wrong.

Location Drift

AEDs get moved, relocated to storage, or removed without registry updates.

Expired Devices

Batteries and pads expire. No system flags this in public databases.

Access Barriers

AEDs are behind locked doors, in staff-only areas, or hidden inside cabinets.

Data Silos

Hospitals, cities, and AHA maintain separate lists. None talk to each other.

THE SOLUTION

Project Lifeguard

A real-time, crowdsourced AED verification layer that tells you if the device is **ACTUALLY** there — before you need it.

Locate

Find every AED within range, mapped in real-time.

Verify

Community confirms: Is it there? Is it accessible?

Alert

Flag expired, missing, or inaccessible units instantly.

HOW IT WORKS

Four steps. Zero complexity.

01

User Opens App

GPS locates them. Nearest AEDs appear on map within seconds.

02

Community Verifies

Passersby confirm AED presence, condition & access during daily routines.

03

Data Gets Flagged

Unverified or expired units are surfaced to facility managers.

04

Registry Updates

Municipalities receive clean, current data. Lives improve before a crisis hits.

WHO THIS HELPS

Everyone in the chain.

Bystanders

Locate a working AED in the critical first 2 minutes.

EMS Dispatchers

Direct callers to verified AEDs, not guesses.

Municipalities

Receive live registry audits. Reduce liability.

Hospitals & Health Orgs

Prove community AED coverage to accreditors.

Researchers

Real-world cardiac arrest geography + response data.

Facility Managers

Automatic compliance alerts before inspections.

We tested the assumption.

THE ASSUMPTION

AEDs are where databases say they are.

Field test planned:

Walk/drive to 10 listed AEDs within 5mi
Time each locate attempt
Document accuracy rate
Run bystander simulation

DECISION RULE

**If 30%+ of listed AEDs fail —
build the verification layer, not just a
finder.**

What 'fail' means:

- Device is missing or moved
- Not findable in under 90 seconds
- Locked or inaccessible
- Expired battery/pads

PROJECT LIFEGUARD

Real AEDs. Real Locations. Real Time.

We are looking for:

- | | | |
|----|-----------------------|--|
| 01 | Field partners | EMS coordinators or health orgs to co-run the pilot verification audit |
| 02 | Data access | Municipal AED registries we can cross-reference in the field test |
| 03 | Advisors | Health tech builders, cardiac arrest advocates, or health system insiders |
| 04 | Early adopters | Organizations ready to embed a verification widget or app in their safety workflow |

Every second matters. Let's not waste them.
